Chapter 2

Networks & Graphs: Basic Measures

Summary

- Graph representations
- Type of Networks
- Degree distribution
- Paths & Connectedness
- Clustering

Reading

• Chapter 2 of Barabasi's book

The Bridges of Konigsberg

Can one walk across the seven bridges and never cross the same bridge twice?

Famous Konigsberg Citizens Immanuel Kant (philosopher, 1724-1804)

Euler's theorem (1735)

- If a graph has more than two nodes of odd degree, there is no path.
- If a graph is connected and has no odd degree nodes, it has at least one path.

Components of a Complex System

Networks or Graphs?

Network <nodes, links> refers to real systems (www, social network, metabolic network)

Graph <vertices, edges> mathematical representation of a network (web graph, social graph)

		Symbol
Components	nodes, vertices	Ν
Interactions	edges, links	L
System	network, graph	(N,L)

A Common Language

The choice of the proper network representation determines our ability to use network theory successfully.

In some cases there is a unique, unambiguous representation. In other cases, the representation is by no means unique.

The way we assign the links between a group of individuals will determine the nature of the question we can study.

Proper representations (examples)

If you connect individuals that work with each other, you will explore the *professional network*.

If you connect those that have a romantic and sexual relationship, you will be exploring the *sexual networks*.

If you connect individuals based on their first name (e.g., all Peters connected to each other), you will be exploring what?

It is a network, *nevertheless*.

Directedness

Undirected graphs

Links: undirected (*symmetrical*)

Examples of Undirected links Co-authorship links Actor network Protein interactions

Directed graphs (DiGraphs) Links: directed (*arcs*).

Example of Directed links URLs on the www

Reference Networks

Degree, Average Degree, Degree Distribution

Node Degree

Undirected graphs

the number of links connected to the node

Directed graphs (DiGraphs)

we can define an in-degree and out-degree. The (total) degree is the sum of in- and out-degree.

A Bit of Statistics

Four key quantities characterize a sample of N values $x_1, ..., x_n$

Average (mean):

$$\langle x
angle = rac{x_1+x_2+\ldots 1x_3}{N} = rac{1}{N}\sum_{i=1}^n x_i$$

The nth moment:

$$\langle x^a
angle = rac{x_1^n + x_2^n + \ldots - x_n^n}{N} = rac{1}{N}\sum_{k=1}^N x_i^n$$

The Standard deviation:

$$\sigma_\lambda = \sqrt{rac{1}{N}\sum_{i=1}^N (x_i - \langle x
angle)^2}$$

The Distribution of *x*:

$$p_x = rac{1}{N}\sum_i \delta_{x,x_i}$$

where p_v follows

$$\sum_x p_x = 1 igg(\int p_x dx = 1igg)$$

Average Degree

Directed graphs (DiGraphs)

Undirected graphs

N - the number of nodes in the graph

Reference Networks: Average Degree

Degree Distribution

P(k): probability that a randomly chosen node has degree k

> $N_k = \#$ nodes with degree k P(k) = $N_k / N \rightarrow plot$

Degree Distribution (cont'd)

Discrete Representation: p_k is the probability that a node has degree k.

Continuum Description: p(k) is the pdf of the degrees, where

$$\int_{k_1}^k p(k) dk$$

represents the probability that a node's degree is between ${\rm k_1}$ and ${\rm k_2}.$

Normalization condition:

$$\sum_a^\infty p_k = 1 \quad \int_{\kappa_{min}} p(k) dk = 1$$

where K_{\min} is the minimal degree in the network.

Adjacency matrix

Undirected graphs

Directed graphs (DiGraphs)

Paths and Connectedness

Paths

Examples of phats in an undirected graph.

A *path* is a sequence of nodes in which each node is adjacent to the next one

 $P_{i0,in}$ of length *n* between nodes i_0 and i_n is an ordered collection of *n*+1 nodes and *n* links

 $P_{n} = \{i_{0}, i_{1}, i_{2}, ..., i_{n}\}$ $P_{n} = \{(i_{0}, i_{1}), (i_{1}, i_{2}), (i_{2}, i_{3}), ..., (i_{n-1}, i_{n})\}$

In a directed graph, the path can follow only the direction of an arrow.

Distance in a Graph

Undirected graphs

The *distance* (*shortest path*, *geodesic path*) between two nodes is defined as the number of edges along the shortest path connecting them.

*If the two nodes are disconnected, the distance is infinity.

Directed graphs (DiGraphs)

Each path needs to follow the direction of the arrows.

Thus in a digraph the distance from node A to B (on an AB path) is generally different from the distance from node B to A (on a BCA path).

Number of paths between two nodes

N_{ij},number of paths between any two nodes *i* and *j*:

Length n=1:

If there is a link between *i* and *j*, then $A_{ij}=1$ and $A_{ij}=0$ otherwise.

Length n=2:

If there is a path of length two between *i* and *j*, then $A_{ik}A_{ki}=1$, and $A_{ik}A_{ki}=0$ otherwise.

The number of paths of length 2:

$$N_{ij}^{(2)} = \sum_{k=1}^{N} A_{ik} A_{kj} = [A^2]_{ij}$$

Length n:

In general, if there is a path of length *n* between *i* and *j*, then $A_{ik}...A_{ij}=1$ and $A_{ik}...A_{ij}=0$ otherwise.

The number of paths of length *n* between *i* and *j* is^(*)

$$N_{_{ij}}^{(n)} = [A^n]_{ij}$$

(*) Holds for both directed and undirected networks.

Distance between node 0 and node 4:

1. Start at 0.

Distance between node 0 and node 4:

- 1. Start at 0.
- 2. Find the nodes adjacent to 1. Mark them as at distance 1. Put them in a queue.

Distance between node 0 and node 4:

- 1. Start at 0.
- 2. Find the nodes adjacent to 1. Mark them as at distance 1. Put them in a queue.
- 3. Take the first node out of the queue. Find the unmarked nodes adjacent to it in the graph. Mark them with the label of 2. Put them in the queue.

Distance between node 0 and node 4:

Repeat until you find node 4 or there are no more nodes in the queue.

The distance between 0 and 4 is the label of 4 or, if 4 does not have a label, infinity.

Diameter and Average distance

Diameter (d_{max}):

the maximum distance between any pair of nodes in the graph.

Average path length/distance, <d>, for a <u>connected</u> graph:

$$\langle d \rangle \equiv \frac{1}{2L_{\max}} \sum_{i,j \neq i} d_{ij}$$

where d_{ii} is the distance from node *i* to node j

In an *undirected graph* $d_{ij} = d_{ji}$, so we only need to count them once:

$$\langle d \rangle \equiv \frac{1}{L_{\max}} \sum_{i,j>i} d_{ij}$$

Shortest Path

The path with the shortest length between two nodes (distance).

Diameter

The longest shortest path in a graph.

Average Path Length

The average of the shortest paths for all pairs of nodes.

Cycle A path with the same start and end node.

Self-Avoiding Path A path that does not intersect itself.

Eulerian Path/Cycle A path that traverses each link exactly once. Hamiltonian Path/Cycle A path that visits each node exactly once.

Connectivity of undirected graphs

Connected (undirected) graph:

any two vertices can be joined by a path.

A **disconnected graph** is made up by two or more **connected components**.

Bridge:

if we erase it, the graph becomes disconnected. Example (A,F)

> Largest Component: Giant Component The rest: Isolates

Connectivity of undirected graphs

The adjacency matrix of a network with several components can be written in a block-diagonal form, so that nonzero elements are confined to squares, with all other elements being zero.

1	0	1	1	0	0	0	0	١
	1	0	1	1	0	0	0	
	1	1	0	0	0	0	0	
	0	1	0	0	0	0	1	3
	0	0	0	0	0	1	1	
	0	0	0	0	1	0	1	
1	0	0	0	1	1	1	0	1

Connectivity of directed graphs

Strongly connected directed graph (SCC):

has a path from each node to every other node and vice versa (e.g. AB path and BA path).

Weakly connected directed graph (WCC):

it is connected if we disregard the edge directions.

Strongly connected components can be identified, but not every node is part of a nontrivial strongly connected component.

In-component: nodes that can reach the scc,

Out-component: nodes that can be reached from the scc.

Complete Graph

A graph with degree

L=L_{max}

is called a complete graph, and its average degree is

<k>=N-1

The maximum number of links an undirected network of N nodes can have is:

What about directed networks?

Network Density

Ratio of existing edges over possible ones.

Examples

d(G) = 1

Complete graph

Sparse graph d(G) = 2/3

Most networks observed in real systems are sparse

L << L _m <k> << N d(G) <<</k>	nax N-1 1			Sparse Adjacency matrix

· 如果我们的问题。我们的问题,我们不知道。

How "clustered" is my network?

Global Clustering coefficient

- Triangles and triplets
- C in [0,1]

 $C = rac{3 imes ext{ number of triangles}}{ ext{ number of all triplets}}$

Watts & Strogatz, Nature (1998)

What fraction of your neighbors are connected?

Local Clustering coefficient

- Node i with degree k_i
- C_i in [0,1]

$$C_i = rac{2e_i}{k_i(k_i-1)}$$

Watts & Strogatz, Nature (1998)

What fraction of your neighbors are connected?

Local Clustering coefficient

- Node i with degree k_i
- C_i in [0,1]

What fraction of your neighbors are connected on average?

Average Clustering coefficient

- Average of local clustering coefficients
- C in [0,1]

Bipartite Networks

Bipartite Graphs

Bipartite graph (or bigraph)

a graph whose nodes can be divided into two disjoint sets U and V such that every link connects a node in U to one in V.

Examples

Hollywood actor network Collaboration networks Disease network (diseasome)

Projection

Two nodes of the **same class** are connected by a (weighted) edge if they share at least a **common neighbor**

Gene - DiseNetwork ase Network

Goh, Cusick, Valle, Childs, Vidal & Barabási, PNAS (2007)

Ingredient-Flavor Bipartite Network

Y.-Y. Ahn, S. E. Ahnert, J. P. Bagrow, A.-L. Barabási Flavor network and the principles of food pairing, Scientific Reports 196, (2011).
